Notes taken from Johns Hopkins University Coursera course series Data Science Specialization.

R Data Types

- Basic object is vector of same class except list.
- Atomic classes of objects: character, numeric (real), integer, complex, logical.
- Attributes can include names, dimnames, dimensions, class, length.

Atomic Data

```
# numeric Vector
x <- 5 # numeric vector of 1 element

# integer vector
x <- 5L # integer vector of len 1

x <- Inf # special number infinity, +/-
x <- NaN # special number undefined, usually hijacks operations

# character vector
msg <- "hello" # char vector of len 1

# logical vector
tf <- TRUE # logical vector of value true
# TRUE = 1 = T, FALSE = 0 = F, num > 0 = TRUE

# complex vector
x <- 1+4i # vector of complex num of len 1
```

complex Data Types

```
# vector
vector("numeric", length = 10) # create vector of one type, args: class, length

## [1] 0 0 0 0 0 0 0 0 0 0
```

```
c(1,2,3,4) # creates vector of common denominator class with given values
```

```
## [1] 1 2 3 4
```

```
1:20 # vector sequence of 20 elements 1-20
```

```
## [1] 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20
```

```
pi:10 # will not exceed 10, start from pi, increment by 1
```

```
## [1] 3.141593 4.141593 5.141593 6.141593 7.141593 8.141593 9.141593
```

```
15:1 # increment -1
```

```
## [1] 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1
```

```
seq(1,20) # same as :
```

```
## [1] 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20
```

```
seq(0,10,by=0.5) # to change increment
```

```
## [1] 0.0 0.5 1.0 1.5 2.0 2.5 3.0 3.5 4.0 4.5 5.0 5.5 6.0 6.5 7.0

rbind(1:3,10:12) # same but using rows

```

```

##      [,1] [,2] [,3]
## [1,]    1    2    3
## [2,]   10   11   12

```

```

# factors
# self-describing type of vector representing categorical data, ordered or unordered (labels)
x <- factor(c("male","female","female","female","male")) # character vector with specific linear model
f <- gl(3,10) # factor 3 levels, 10 times each
table(x) # prints counts of each factor

```

```

## x
## female  male
##      3     2

```

Data Frames

```

# stores tabular/rectangular data, stored as lists of same length where each element is a column, length
x <- data.frame(foo=1:4, bar=c(T,T,F,F)) # creates data frame 2 columns foo and bar, 4 rows unnamed. Ca
x <- read.table(file = "hw1_data.csv", header = TRUE, sep = ",") # read in data from file
x <- read.csv("hw1_data.csv") # same

```

Date and Time Data Types

```

# useful for time-series data (temporal changes) or other temporal info
# lubridate package by Hadley Wickham

```

```
# Dates and Times
birthday <- as.Date("1970-01-01") # dates are date class defined by converting character string, year-m
today <- Sys.Date()

currentTime <- Sys.time() # time by POSIXct (large integer vector, useful in dataframe) or POSIXlt (list,
timedefined <- as.POSIXct("2012-10-25 06:00:00") # convert char vector, can define timezone
cTConvert <- as.POSIXlt(currentTime) # reclass, works other way
cTConvert$min # to subset list
```

```
## [1] 14
```

```
datestring <- c("January 10, 2012 10:40", "December 9, 2011 9:10")
x <- strptime(datestring, "%B %d, %Y %H:%M") # Convert character vector to POSIXlt by defining format (
x
```

```
## [1] "2012-01-10 10:40:00 EST" "2011-12-09 09:10:00 EST"
```

```
weekdays(birthday) # return day of week, date or time classes
```

```
## [1] "Thursday"
```

```
months(birthday) # return month on date or time
```

```
## [1] "January"
```

```
quarters(birthday) # return quarter of date or time
```

```
## [1] "Q1"
```

```
# Operations
# CANNOT MIX CLASSES - convert
# add and subtract dates, compare dates
currentTime - timedefined # time difference, track of discrepancies (i.e. daylight savings, timezones, l
```

```
## Time difference of 4454.427 days
```

```
difftime(currentTime, timedefined, units = "days") # to specify unit
```

```
## Time difference of 4454.427 days
```

Basic R Functions

Functions and Operations

```
# Input and Evaluation  
x <- 1 # assignment operator, evaluates and returns  
print(x) # print value as vector
```

```
## [1] 1
```

```
x # auto-prints
```

```

Defining Functions

stored in txt or R script, functions are R objects. Can pass functions as arguments for other functions

```
myfunction <- function(){ #create a function
  x <- rnorm(100)
  mean(x)
}
myfunction() #call created function
```

```
## [1] -0.1028367
```

myfunction # prints source code for function

```
## function ()
## {
##   x <- rnorm(100)
##   mean(x)
## }
```

```
args(myfunction) # returns arguments for passed function
```

```
## function ()  
## NULL
```

```
myaddedfunction <- function(x,y){ #create a function with formal arguments x and y  
  x + y + rnorm(100) # implicit return last expression  
}  
myaddedfunction(5,3)
```

```

Cleaning Data

- End of process generate: raw data, tidy data set, code book (metadata) describing each variable and its values in the tidy data set, explicit and exact recipe used to convert raw data to tidy data set and code book.

- Raw Data: original source of data i.e. no processing, editing, summarizing. Must process for data analysis (merging, sub-setting, transforming, etc.), be mindful of processing standards. Colloquially may be later step i.e. genome seq but must use rawest.
- Processed Data: ready for analysis, steps to reach stage must be recorded. Must: one variable per column, each observation in a separate row, different tables for different types of variables, if multiple tables allow for linking. Useful: top row of variable names which are human readable, save one file per table.
- Code book: info about variables not contained in data incl. units called *Code book*, info about summary choices, info about experimental study design called *Study design*. Often word/text file.
- Instruction list: in a computer script where input is raw data and output is tidy data with no parameters to the script. If not possible, provide instructions in steps (incl. parameters, software versions, how to use software).

Graphics

<http://www.ling.upenn.edu/~joseff/rstudy/week4.html>

```
# Start by getting sense of the data: dim(), names(), head(), tail() and summary().

# Scatterplot
data(cars)
plot(cars) # generates scatterplot with two columns against each other
```

```
plot(x = cars$speed, y = cars$dist) # explicit, can also pass plot(dist ~ speed, cars). Args: x, y = NU
```

```
# Boxplot
data(mtcars)
boxplot(mpg ~ cyl, data = mtcars) # generate relationship between mpg(x) and cyl(y) from mtcars
```

```
# Histogram  
hist(mtcars$mpg) # generate a histogram of vector
```

R Profiler and Optimization

- Systematic way to examine time spent in various part of the program. Useful to optimize the code.
- DON'T PREMATURELY OPTIMIZE
- Measure, not guess, data on what needs to be optimized.
- User time: computer experienced, may be greater if multiple cores/processors (accessible in multi-threaded BLAS libraries). Elapsed time: wall-clock time, may be greater if other computing tasks.

```
system.time(read.csv("hw1_data.csv")) # returns seconds to execute, if error then seconds to error. Wrap
```

```
##      user  system elapsed
##         0         0         0
```

```
data(mtcars)
Rprof() # track function call stack at intervals (def = 0.02 sec), time spent in functions.

fit <- lm(mtcars$mpg ~ mtcars$cyl)

Rprof(NULL)

summaryRprof() # makes Rprof readable, tabulates, time in each function
```

```
## $by.self
## [1] self.time self.pct total.time total.pct
## <0 rows> (or 0-length row.names)
##
## $by.total
## [1] total.time total.pct self.time self.pct
## <0 rows> (or 0-length row.names)
##
## $sample.interval
## [1] 0.02
##
## $sampling.time
## [1] 0
```

```
# $by.total - divides time spent per function by total run time
```

```
# $by.self - same as by.total but first subtracts time spent in function above in call stack. Helps tar.
```
